

DETEXTITY

Autonomous Counter-UAS Systems

Detect. Decide. Neutralise.

Janis Krauklis, CEO | Toms Miks, CTO

Current Counter-UAS Systems Are Blind

FPV Drones with Fiber Optic Guidance

Immune to RF jamming. Undetectable by electronic warfare systems. Used extensively in Ukraine conflict.

Market Leaders Are Vulnerable

Dedrone, DroneShield, and others rely heavily on RF detection. They cannot detect or respond to fiber-optic guided threats.

Electronic Warfare Doesn't Work

In contested electromagnetic environments, RF-dependent systems fail. No fallback capability.

The next generation of drone threats requires a fundamentally different approach.

Detection That Works in Contested Environments

OrbiDetect: Multi-Sensor Fusion Platform

360 degree visual detection system that operates independently of electronic signatures

Acoustic Detection

Passive listening arrays identify drone signatures regardless of guidance method

Visual Tracking

AI-powered optical detection with full 360 degree coverage on fixed or mobile platforms

Kinetic Sensing

Movement and proximity detection for close-range threats

AI-driven sensor fusion delivers reliable detection when RF systems fail

Threat Evolution Demands New Technology

Ukraine Conflict

Fiber-optic FPV drones are now standard.
Traditional counter-UAS is obsolete.

NATO Urgency

Member states actively seeking solutions for
contested EM environments.

Critical Infrastructure

Energy, transport, and border security require
reliable detection regardless of EW.

Market Size

\$7B+

Global counter-UAS market by 2030

Technology Ready

Edge AI and computer vision capabilities now
enable real-time visual detection at scale

Edge AI-Powered Detection and Response

Real-time AI inference at the edge for autonomous decision-making in milliseconds

AI Classification

- Deep learning models
- Trained on real drone data
- Low false-positive rate
- Real-time threat assessment

Sensor Fusion

- Multi-modal data integration
- Cross-correlation algorithms
- 360 degree coverage system
- Mobile platform capable

Decision Engine

- Autonomous response logic
- Configurable engagement rules
- Human-in-loop options
- Full audit trail

Current Status: AI classification validated in field tests. OrbiDetect prototype operational. Integration phase involved.

Proven Defense Tech Experience

Toms Miks, CTO

Sole Computer Vision Developer for interceptor drone project

Currently in procurement by Belgian Ministry of Defence

Applying proven kinetic interception expertise to ground-based counter-UAS systems

Domain Expertise

Deep experience in drone-vs-drone engagement. Understanding of real operational requirements from active defense procurement.

Technical Edge

Computer vision algorithms tested in real kinetic scenarios. Not theoretical - battle-tested technology.

Defense Network

Direct relationships with NATO defense procurement. Understanding of certification and compliance requirements.

Execution Experience

Janis: 20 years management experience. Track record of taking complex technical projects to market.

Government Procurement Strategy

Phase 1: EU/NATO Markets

Defense Procurement

Direct to ministries of defence through existing relationships

Critical Infrastructure

Energy sector, airports, borders - high-value targets.

Strategic Advantage

EU-developed technology. ITAR-free. NATO interoperability.

12-Month Milestones

Q1-Q2 2026 **Complete OrbiDetect integration**

Q3 2026 **Field demonstrations with target customers**

Q4 2026 **Pilot deployments at 2-3 sites**

Q1 2027 **First commercial contracts**

Target: TRL 7 and initial revenue within 12 months

Funding and Support

Current Status

- ✓ Bootstrapped to date
- ✓ AI classification validated
- ✓ Work on OrbiDetect MVP
- ✓ Proven team with defense credentials

Raising 150K EUR

Pre-seed round to reach TRL 7

- Complete system integration
- Field demonstrations
- Pilot deployments
- First customer contracts

Building the counter-UAS system that works when others fail
